## Section 2.2 Extra Practice

1. Convert each of the following rates into a unit rate.

Example: 110 km in $15 \mathrm{~h} \rightarrow \frac{7.4 \mathrm{~km}}{1 \mathrm{~h}}$
a) 1200 words in 45 minutes
b) 25 cars sold in 5 days
c) 25 L of gas used to travel 390 km
d) 80 meters per 4 min
2. Determine the unit rate in each situation.

Example: There were 180 people on 3 buses. $\frac{180}{3}=60$ people per bus
a) 15 hours of TV in 3 days
b) 282 tickets sold in 6 nights

For \#3 and \#4, do the following for each product:
3. a) and b) Calculate the unit price of each brand. Show your work. c) Identify the best buy.

| Item | a) Unit Price <br> Brand $\mathbf{A}$ | b) Unit Price <br> Brand B | c) Best <br> Buy |
| :--- | :--- | :--- | :--- |
| Example: <br> Salsa $(425 \mathrm{~mL})$ | 2 for $\$ 6.49=$ <br> $\$ 3.25$ | 3 for $\$ 8.99=\$ 3$ | Brand B |
| Plastic wrap $(30 \mathrm{~m})$ | 8 rolls for $\$ 20$ | $\$ 29.40$ for 12 rolls |  |
|  |  |  |  |
|  |  |  |  |

| Item | a) Unit Price <br> Brand $\mathbf{A}$ | b) Unit Price <br> Brand B | c) Best <br> Buy |
| :---: | :---: | :---: | :---: |
| Fruit juice $(355 \mathrm{~mL})$ | 6 pack for $\$ 4.68$ | 4 pack for $\$ 3$ |  |
|  |  |  |  |
|  |  |  |  |
|  |  |  |  |

5. Calculate the fuel efficiency of each car. Show your work.

- For Step 1, calculate the litres of fuel used per kilometre. Give your answer to the nearest ten-thousandth.
- For Step 2, multiply the unit rate by 100 . Round to the nearest hundredth.

| Car | Distance <br> (km) | Fuel Used <br> (L) | Step 1: Unit Rate <br> $\mathbf{( L / k m )}$ | Step 2: Fuel <br> Efficiency <br> (L/100 km) |
| :---: | :---: | :---: | :---: | :---: |
| Example: | 248 | 20 | $\frac{20 \mathrm{~L}}{248 \mathrm{~km}}=0.0806 \mathrm{~L} / \mathrm{km}$ | $0.0806 \times 100$ <br> $=8.06 \mathrm{~L} / 100 \mathrm{~km}$ |
| a) Car A | 639 | 45 |  |  |
| b) Car B | 688 | 80 |  |  |
