

Term: parts of an expression or equation separated by $+$ or $-$

# of Term	Type of Polynomial	Examples
1	<u>Monomial</u>	$x, 9, -2y, 3a^2b^3$
2	<u>Binomial</u>	$2x-4, -x^3+3z^2$
3	<u>Trinomial</u>	a^2+4a-8
4 or more	Polynomial	$5mn+m^2+2n-6$

Degree of a Term:

Steps to find degree

- ① Ignore coefficients and constants.
- ② Look at variable's exponents.
- ③ Do not combine terms.
- ④ Pick highest degree on term

ex: 1) $8x^2y^3 + x^3y + xy + 6 = \text{degree of } 5$

$d=5 \star$ $d=4$ $d=2$ $d=0$

2) $-a^2b^3c^2 + 8a^2bc^2 + a^2b + bc + c = \text{degree of } 7$

$d=7 \star$ $d=5$ $d=3$ $d=2$ $d=1$

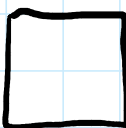

Combining Like terms

- Coefficients are added or subtracted together for the same variables
- Constants are added or subtracted

ex: $4x^2 - 8x + 2 + x^2 + 3x - 5$

$4x^2 + x^2 - 8x + 3x + 2 - 5$

$5x^2 - 5x - 3$

Algebra Tiles:      

x^2 $-x^2$ x $-x$ 1 -1

Solve using tiles:

$2x^2 - 3x + 4 - x^2 - x - 2$

$$2x^2 - 3x + 4 - x - x - 2$$
